

David Wayne

Senior Full-Stack Engineer — React, TypeScript, AI Systems & Integrations

djwayne35@gmail.com · (202) 869-5478 · github.com/Wolverine971 · linkedin.com/in/djwayne

Summary

Senior full-stack engineer with 8+ years shipping production web applications. Deep React + TypeScript across complex, mature codebases, with hard-won experience in enterprise integrations and AI systems engineering. Founder of **BuildOS**, an AI-first project management platform that users and their agents connect to so they work from one shared source of truth. Built on a multi-LLM routing layer, agentic Calendar/MCP integration, and a custom Supabase-native job queue. Previously at Curri rebuilt the React-based live operations console and owned the integration layer connecting the delivery network to Lyft, Uber, DoorDash, and four regional partners. Former US Marine Corps Scout Sniper Team Leader.

Technical Skills

- **Frontend:** React, Next.js, TypeScript, Redux-pattern state management (VueX, NgRx, Svelte stores), Vue 2/3, AngularJS, Angular, Svelte / SvelteKit, Tailwind, real-time UIs (SSE, WebSockets), map UIs (Mapbox)
 - **Backend:** Node.js, Express, C#, Java, REST, webhooks, OAuth / credential exchange, async job queues
 - **AI / LLM:** OpenRouter, multi-provider model routing with fallback (OpenAI / Anthropic / Moonshot), prompt caching, tool calling, streaming, JSON mode, MCP-style agent integration, context engineering, agent harness design
 - **Data:** PostgreSQL, Supabase (Row-Level Security, RPC), Elasticsearch, SPARQL / knowledge graphs
 - **Infrastructure:** Vercel, Railway, Turborepo + pnpm workspaces, Twilio, Google OAuth, GitHub Actions
-

Experience

BuildOS — Founder & Engineer · Mar 2025 – Present

AI-first project management platform that users and their agents connect to so they work from one shared source of truth · build-os.com · 80+ beta users

- Designed and shipped the full platform solo: SvelteKit web app on Vercel, Node.js worker service on Railway, Turborepo monorepo (pnpm workspaces), Supabase Postgres with row-level security.
- **Shipped the full user-facing surface to 80+ beta users** — brain-dump capture (text + voice), project and task views, a real-time streaming chat UI, daily-brief email composition, and SSE-driven progress for long-running LLM jobs.
- Built a **multi-LLM routing layer** that scores requests by task complexity, latency, and cost and routes across OpenRouter (primary) with OpenAI / Anthropic / Moonshot as direct fallbacks. Supports streaming, tool calling, and JSON mode.
- Built an **agentic chat** that reads and writes the user's Google Calendar and executes project actions via tool use. Exposes a clean integration surface so external agents (e.g. Claude Code, MCP-style harnesses) can drive BuildOS on a user's behalf.
- Designed a **Redis-free job queue** on top of Supabase using `FOR UPDATE SKIP LOCKED` for atomic job claims. Powers daily brief generation, brain-dump processing, voice transcription, OCR,

ontology classification, and SMS workflows.

- Integrated Twilio (SMS), Google OAuth, and three direct LLM provider SDKs.
- Invested deeply in **context engineering and agent harness design** — the discipline of selecting the right tools, schemas, and context so LLM tool calls behave reliably in production.

Curri (YC S19) — Software Engineer · Jan 2022 – Feb 2025

*B2B same-day construction-materials delivery platform. Monolithic React + TypeScript codebase with three web frontends — the internal admin and customer booking app both built on **Next.js**, plus a public marketing site — a React Native driver app, and a Node worker service running the driver-search algorithm and async delivery jobs.*

- **Rebuilt Curri's service-ops console into a real-time, event-driven triage system.** Replaced a static delivery dashboard with a prioritized alert queue that surfaced exceptions — driver-search timeout, assigned-driver cancellation, driver stalled at pickup, ETA overrun — to ops reps the moment they needed to act, with the resolving action exposed inline. Designed the upstream signal model and coordinated cross-system changes across the worker service and the integration layer to emit the events the console consumed. The console was built around operator throughput: keep the right delivery in front of the rep, with the right control one click away. Partnered closely with PM and design.
- **Built and owned Curri's third-party delivery integration layer.** Connected seven delivery service providers — **Lyft, Uber, DoorDash, Dispatch, Pronto, Material Drop, Superior** — into Curri's driver-search algorithm so deliveries could dynamically fail over to an external network when no in-network driver was available, recovering deliveries that would otherwise have lost money on small / unprofitable jobs or left customers stranded.
 - **Reverse-engineered every partner's delivery API.** Public docs were typically incomplete or missing; pieced together the contracts by hand for Lyft, Uber, DoorDash, Dispatch, Pronto, Material Drop, and Superior.
 - Designed a hybrid **webhook + polling reconciliation pattern** to maintain ground-truth delivery state across partners with inconsistent or partial event coverage.
 - Built the **OAuth and credential-exchange flows** and partner-specific API contracts for each integration; pre-fetched pricing quotes so any open delivery could be dispatched to Uber / Lyft / DoorDash on demand.
 - At scale the layer routed an estimated 100–200+ deliveries per day per partner, including high-margin specialty equipment (box trucks, stake beds, flatbeds) the in-network fleet couldn't service.
- **Built an interactive sales / leadership map** showing geographic delivery activity, regional metrics, and customer-specific delivery patterns. Gave sales reps a fast read on where deliveries were happening and how individual accounts were spending; gave leadership a territory-level view for strategic decisions.

C4 Planning Solutions — Software Engineer · Mar 2021 – Dec 2021

Military Justice Case Management System (Department of Defense client) used by military lawyers to look up case and trial information across the DoD military justice system.

- Performed substantial **data migrations of legacy case data** into the production system; built reusable migration tooling to format and load incoming data.
- Tackled bug fixes and new feature work in an Agile environment. Stack: Vue, jQuery, SharePoint.

Webworld Technologies — Software Engineer · Aug 2019 – Mar 2021

Dewey Knowledge Portal — proof-of-concept knowledge platform for US Air Force intelligence analysts. Ingested intel reports and exposed them through a graph data model so analysts could traverse connections across people, places, events, and source documents.

- Designed and built the **nested AND/OR query-builder UI** that compiled visual queries to **SPARQL** and ran them against the underlying knowledge graph — letting analysts express complex connection-driven searches without writing graph queries by hand.
- Built supporting analyst tooling: documentation flows for classifications and citations, dashboards for moving files through change-management processes, and a templating system that returned custom "Wikipedia-style" result pages.
- **Improved frontend performance** across the application by adding memoization to NgRx store effects and caching at the data layer — reducing redundant API calls and re-renders. Worked in an Angular + NgRx codebase with heavy state-management and visualization concerns.

MetroStar Systems — Software Engineer · Apr 2018 – Aug 2019

US Census Bureau — Center for Enterprise Dissemination Services and Consumer Innovation (CEDSCI)

- Re-architected an aging **AngularJS application into Vue** as part of a joint contract team (~5 frontend / 5 backend, plus data engineers and SMEs) delivering a single-search-bar interface across the Census Bureau's multidimensional public datasets.
- Built the **central search-bar component** — the product's primary interface — engineered for responsiveness, keyboard navigation, and **Section 508 / WCAG accessibility** compliance including JAWS screen-reader support.
- Owned heavy **frontend state management in Vuex** for multi-dimension faceted search and filtering.
- Led stakeholder demos and participated in agile ceremonies with 100–200 government stakeholders and subject-matter experts in attendance.

Sabio — Full Stack Developer · Apr 2017 – Jan 2018

Hired by the Sabio bootcamp upon graduation to build internal tools and client work.

- Built a real-time **student-management application** (AngularJS + C# + SQL + SignalR) that managed an instructor/student help queue with one-on-one routing.
- Led the "Intro to Web Development" community meetup, walking attendees through building a working blog from scratch.
- Built an internal operations application for the Youth Mentoring Connection nonprofit using Agile delivery.

Military Service

US Marine Corps · 2012 – 2017

Scout Sniper Team Leader · Infantry

- Deployed to **Afghanistan (2013)** with an infantry line platoon supporting the retrograde of US forces from the country.
- Graduated **Marine Scout Sniper School (2015)** — qualified for the elite reconnaissance and precision-marksmanship community.
- Deployed to **Kuwait (2016)** as a **Scout Sniper Team Leader**, serving as the Quick Reaction Force for operations across the area of responsibility.

- **Honor Graduate, Corporal / Non-Commissioned Officer Course** — top of class in the Marine Corps' professional NCO leadership program.
-

Education

- **Web Development Certificate** — Sabio Coding Bootcamp (partnered with Antioch University), 2017
 - **Two years of community college coursework**
-

Personal Projects

- 9takes.com — Reddit-style discussion site organized around the Enneagram personality framework. Built solo on Vue + Nuxt + GraphQL + Elasticsearch + MongoDB. 15K+ monthly unique visitors, 1,500+ weekly uniques, 100+ registered users.
- thecadretraining.com — Live booking site for a long-range precision rifle training company. Drives course signups for active classes.
